

## Welcome to Devaway's technical test

Hi there! Thank you for participating in this technical test, we hope you can enjoy it and it would be useful to get to know you better. Let's go with the needs!

One of our clients is a big fan of the *Ricky & Monty* series, so they have asked us to make an application which shows all the information about this series.

Specifically, they want a website made of two type of pages:

- On one hand, a main page where they can see a list of all the characters with general information about them.
- On the other hand, an individual page where they can see in detail the information of each character, so they can have access to all their data. This page should be able to be shared with a unique link.

Both pages must be able to be visualized from a mobile phone and a computer.

Moreover, and as an optional improvement, the client needs us to implement a search filter by character's name because there are a lot of characters in the series.

To start with the project, they gave us all the information through their API: [Project's API; free and no need an API key](#)

We don't mind what language or framework you want to use. We only need that you can deliver it to us in a GITHUB repository.

As you know, for any questions you may have, you have the Slack group where a colleague will be able to solve those doubts without problem.

Good luck and we hope to see the result soon!
